

Evidence organized before you ever ask for it.

"I ask once and get a folder of screenshots with no dates on them."

Tuesday morning

A fieldwork clock already running, and the evidence spread across whatever the client's tools happened to export.

They search for: C3PAO assessment software · CMMC evidence sampling · compliance evidence package export · read-only auditor access

How CMDash answers it

1. A scoped grant, not a shared login

A time-boxed, read-only invite from the client — every practice or control in the frameworks they named, and nothing outside that scope: no billing, no integrations console, no other client's data.

2. Evidence already organized by control

Every control carries the evidence behind it, plus the request thread where you asked for anything missing — not a shared drive of loose PDFs.

3. Built for fieldwork, not a screenshot tour

An evidence package bundles every approved item for a

framework into one manifest, and a sampling export draws a statistically valid population from users, access reviews, control assessments and more.

Frameworks assessed through CMDash

 **CMMC Level 2**

 **FedRAMP Moderate**

 **SOC 2 Type II**

 **ISO/IEC 27001:2022**

Where the evidence comes from

 **Okta**

 **AWS Security Hub**

 **CrowdStrike Falcon**

 **GitHub Advanced Security**
