

Run the security program, not just the audit.

"Security landed on my desk, and I don't know where to begin."

Tuesday morning

A CMMC deadline, a customer's security questionnaire and a cyber insurance renewal, each asking a different question, and no single program that answers all three.

They search for: security program management software · cyber maturity assessment · CMMC and ISO 27001 compliance software · IT security roadmap

How CMDash answers it

1. A program you can see, not a project list

Charter, security objectives, committees and management reviews in one module, with named owners and segregation-of-duties conflicts flagged — the structure the program runs on, before the next framework arrives.

2. A maturity score that moves

Computed from live control state and the tools you already run, not entered by hand, so the trend line answers the one question that matters: is the program improving?

3. One control record, every framework

Start with CMMC. Add ISO 27001 or SOC 2 when the business needs it: the controls you already have carry across, so the next framework starts from what is done, not from a blank spreadsheet.

Frameworks a program grows into

 CMMC Level 2

 ISO/IEC 27001:2022

 SOC 2 Type II

 NIST Cybersecurity Framework 2.0

Where the evidence comes from

 Okta

 Amazon Web Services

 CrowdStrike Falcon
